Subspecies Names Automatically Created by Rule 46

J. P. EUZÉBY*

Laboratoire de Bactériologie, École Nationale Vétérinaire, Toulouse, France

Two type subspecies names created automatically under Rule 46 are presented.

In the course of maintaining my own database, I have discovered two type subspecies names that were created automatically under Rule 46 of the Bacteriological Code (1990 revision) (3) and that had not previously been validly published. *Alcaligenes faecalis* subsp. *faecalis* Castellani and Chalmers 1919, type strain ATCC 8750, was automatically created by the valid publication of *A. faecalis* subsp. *homari* Austin, Rodgers, Forns, and Colwell 1981 (1), with the nomenclatural type being strain L1 (NCMB 2116 or ATCC 33127).

*Staphylococcus schleiferi* subsp. *schleiferi* Freney, Brun, Bes, Meugnier, Grimont, Grimont, Nervi, and Fleurette 1988, type strain N850274 (ATCC 43808), was automatically created by the valid publication of *S. schleiferi* subsp. *coagulans* Igimi et al. 1990 (2), with the nomenclatural type being strain GA211 (JCM 7470).
