The company was founded on the principle that only the highest quality antisera will be produced. The antisera will be certified in terms of titre and specificity before shipment. Only those antisera which meet our rigid specifications will be sold. Such procedures as lyophilization, conjugation or purification are carried out only on those products which would not lose potency by these procedures.

The anti-viral antisera product line now produced by Northeast Biomedical meets these criteria. All anti-viral antisera marketed will be certified by at least three laboratories. It is the company policy not only to meet the Federal Regulations governing the use of diagnostic antisera but to exceed these regulations wherever possible.

Northeast Biomedical Laboratories is committed to staying ahead with and taking an active role in the development of new products and technology.

A step in the right direction
