397–408

Molecular characterization of occult hepatitis B virus in genotype E-infected subjects
409–418

In situ hybridization to detect bandicoot papillomatosis carcinomatosis virus type 1 in biopsies from endangered western barred bandicoots (Perameles bougainville)
419–423

GP64 of group I nucleopolyhedroviruses cannot readily rescue infectivity of group II l-null nucleopolyhedroviruses
M. Westenberg and J. M. Vlak
424–431

Hepatitis C virus proteins interfere with the activation of chemokine gene promoters and downregulate chemokine gene expression
M. Sillanpää, P. Kaukinen, K. Melén and I. Julkunen
432–443

A poorly endotheliotropic and a highly endotheliotropic strain of human cytomegalovirus were compared with regard to their nuclear localization efficiency of incoming virus particles in HUVEC at 6 h after infection. Viral structural antigen pUL32 was visualized by indirect green immunofluorescence (punctate signals). Cellular tubulin was visualized by indirect red immunofluorescence (tubular signals). Counterstaining was done with DAPI (blue nuclear signals). Nuclei are 15 μm in diameter. Image courtesy Dr Christian Sinzger, Institute of Medical Virology, University of Tübingen, Germany. See the paper by Sinzger et al. in this issue, pp. 359–368.
Complete genomes of three subtype 6t isolates and analysis of many novel hepatitis C virus variants within genotype 6
