Relations Between Structure and Function in the Prokaryotic Cell

Edited by R. Y. STANIER, H. J. ROGERS and B. J. WARD

This volume is concerned with the relations between structure and function in the prokaryotic cell. The structures studied are mostly parts of the cell that can be readily visualised by the electron microscope such as the ribosomes, cell-envelope components, spores and gas vacuoles. The function of these organised structures is considered in relation to their importance to the growing micro-organism and to events happening within the cell. The accounts draw on the most recent biophysical techniques and biological knowledge and the discoveries are placed in general biological perspective.

Measles Virus and Its Biology

K. S. Fraser and S. J. Martin

This first book in the new Series, Experimental Virology, is at the forefront of research on the measles virus, yet its contents are still within the grasp of students of medicine, microbiology and biochemistry. The work sets out the problems of measles and its complications and relates them to recent knowledge of the biological character of the virus. The authors have placed particular emphasis on the predilection of the virus for lymphoid tissue and its ability to set up persistent infection through defective modes of replication. They have stressed too the need to find out more about the relationship between measles virus and immune responses. The significance of such interactions can be seen clearly in the pathogenesis of conditions such as measles enteropathy, subacute sclerosing panencephalitis, multiple sclerosis and certain auto-immune diseases.

Microbial Interactions
EDITED BY JOSE L REISSIG

Leading researchers in the field of microbial communication present nine case histories which not only analyse the nature of the mechanisms of cellular recognition, but also alert the reader to the rich potential of this experimental material.

This field of study, i.e. that of the mechanisms of recognition at cellular level, is today in much the same state that biochemistry was half a century ago, or molecular biology a quarter of a century ago. The influence of microbiology was crucial for the explosive development of these two disciplines. It contributed not only all sorts of methodological short cuts, but also the fine scalpel of genetic analysis, and a penchant for studying basic mechanisms from a composite picture of studies performed with different organisms. Microbial Interactions is grounded in that tradition. Hence the book will be an invaluable aid for all who wish to keep abreast of developments within this field.

The Specificity and Action of Animal, Bacterial and Plant Toxins
PEDRO CUATRECASAS

The emphasis within this book is on the details of the molecular processes involved in the biochemical and physiological mechanism of action of the best studied and most understood toxins of plant, bacterial and animal origin. The intention has been to shed light on normal interactions and processes in integrated biological systems.

'This is an excellent collection of essays giving the most recent views on modern aspects of receptors and related cell biology and covers such topics as the role of calcium in cell activation, hormone receptors and the immune system and membrane organization, as well as dealing with neurotransmitter receptors, their mechanisms, isolation and structure.'

(iii)
JOURNAL OF FOOD TECHNOLOGY

Contents
Observations between the relationship between the surface area and weight of eviscerated carcases of chickens, ducks and turkeys  N. L. Thomas
β-Carotene loss in palm oil used for frying Nigerian snacks  M. V. Rajagopal and S. R. Mudambi
A semi-empirical correlation for prediction of hydration characteristics of paddy during parboiling  S. Bandyopadhyay and N. C. Roy
On the meaning of the degree of milling of rice  Md. Shams-Ud-Din and K. R. Bhattacharya
Moisture determination in starch-rich food products by pulsed nuclear magnetic resonance  E. Brosio, F. Conti, C. Lintas and S. Sykora
Colour changes in tuna during canning and colour improvement by chemical modification of haeme proteins  Ali Khayat
Procedure for the isolation of lipases produced by Pseudomonas species and Achromobacter lipolyticum  J. Scholefield, E. T. O'Donnell and G. Davies
Delayed crystallization of amorphous sucrose in humidified freeze dried model systems  H. A. Iglesias and J. Chirife

Technical Notes
The effect of curing and maturing bacon on muscle pH  W. J. Gallwey and P. V. Tarrant
The incorporation of fresh cassava into bread  J. Crabtree, E. C. Kramer and J. Baldry

The Journal of Food Technology is published bimonthly, each issue consisting of 90–120 pages; six issues form one volume. The annual subscription is £40.00 (U.K.), £48.00 (Overseas), $110.00 (N. America) post free. Back volumes are still available.
