Very many laboratories buy this versatile centrifuge because, with its wide range of "batch" rotors, it can carry up to 6 x 250ml at 12,000 r.p.m. (23,000 x g) or 6 x 100ml at 18,000 r.p.m. (40,000 x g) for example, in addition to rotors for smaller tube sizes. An overriding advantage to many laboratories is its ability to accommodate the Continuous Flow Rotor giving 21,000 x g at 18,000 r.p.m. with a throughput up to 1 litre per minute.

Capacity and performance apart, the High-Speed 18 is a reliable instrument, simple and time saving in operation, having electronic speed pre-selection and control and efficient braking. Temperatures down to 0°C are maintained without use of a vacuum system.

Specialist service engineers located throughout the United Kingdom ensure skilled regular maintenance and are quickly available to carry out any immediate repairs. A regular servicing contract is well worth considering. Have you written for details?
THE JOURNAL OF DAIRY RESEARCH

Established in 1929 as a medium for the publication of the results of original research in dairy science and cognate subjects. Subscription price 80/- per volume of 3 parts, payable in advance. Single copies 30/- each. Subscriptions may be sent to any bookseller or direct to the publishers.

CAMBRIDGE UNIVERSITY PRESS
Bentley House, 200 Euston Road
London, N.W. 1

Contents of Vol. 33, No. 1, February 1966

List of Shortened Titles of Papers

Effect of concentrates on roughage intake. R. C. Campling and J. C. Murdoch.
Effect of concentrates on movement of digesta. R. C. Campling.
Greenish discoloration of butterfat. H. Lück.
n-Alkan-1-ols in oxidized butter. W. Stark and D. A. Forss.
Hanks solution for tissue culture in a new, practical and convenient form

The problem of making stable, precipitate free, stock solutions of this buffer for tissue culture has been overcome. Now it is a simple matter to make up a ten times concentrate, which can be autoclaved, from Oxoid Dehydrated Hanks solution in the new twin sachet presentation.

WEIGHING ELIMINATED
One package contains two sachets, A and B. Each makes a stable stock solution which, when mixed together and diluted, will yield 10 litres of working strength buffer. This is by far the most economic way of purchasing the medium.

BUFFERED BICARBONATE SOLUTION, BR 26
Made specifically for use with Hanks solution, this sterile solution has been buffered with carbon dioxide to a pH of 6.9-7.0. It is thus ready for use. Simply pour the contents of one 25 ml bottle into each litre of Hanks solution.

For samples, information and a manual containing details of the Oxoid range, apply to:

IMMUNOLOGY
An Official Journal of the
BRITISH SOCIETY FOR IMMUNOLOGY
EDITOR: L. E. GLYNN

VOL. 10, NO. 2 February 1966

CONTENTS

S. SHULMAN, C. YANTORNO, W. A. SOANES, M. J. GONDER and E. WITEBSKY. Studies on organ specificity. XVI. Urogenital tissues and autoantibodies.

K. KANO and F. MILGROM. Precipitation test for infectious mononucleosis and enterovirus diseases.

K. C. WATSON. The effect of polysaccharide depolymerizing enzyme in gel diffusion and haemagglutination studies.

J. E. COE and J. D. FELDMAN. Extracutaneous delayed hypersensitivity, particularly in the guinea-pig bladder.

M. FELDMAN and T. MEKORI. Antibody production by 'cloned' cell populations.

G. L. ASHERSON and E. J. HOLBOROW. Autoantibody production in rabbits. VII. Autoantibodies to gut produced by the injection of bacteria.

GRACE L. ROSENQUIST and G. R. CAMPBELL. Characteristics of the 19S and 7S response to bacteriophage FX174 in the fowl.

G. L. ASHERSON. Selective and specific inhibition of 24-hour skin reactions in the guinea-pig. II. The mechanism of immune deviation.

E. GAZENFELD, E. ROSENMANN, A. M. DAVIES and A. LAUFER. Isoproterenol induced myocardial lesions in the immunized and non-immunized rat. II. Histopathological lesions after specific immunization.

The subscription price is £12, post free, per two annual volumes of six parts. Single parts are 25s. each, postage extra

BLACKWELL SCIENTIFIC PUBLICATIONS LTD
5 ALFRED STREET - OXFORD
for growing cultures under controlled conditions

This Orbital Incubator has been designed in consultation with Dr S. J. Pirt, Microbiology Department, Queen Elizabeth College, London, to meet present-day requirements in the fields of microbiology, botany, zoology, virology, bacteriology, biochemistry and metallurgy for incubation under conditions of gentle, continuous agitation. It is one of a range of incubators designed for modern incubation techniques.

CONTROLLED AERATION BY ORBITING ACTION. The gentle orbiting action of the platform minimizes accretion of material ('tide marks') on the sides of the flasks, but ensures controlled aeration of cultures.

CONTROLLED TEMPERATURE. The temperature of the incubator is very closely and reliably controlled by an efficient hot air circulating system working in conjunction with a 'Compenstat' and an independent safety thermostat.

CONTROLLED SPEED. Orbiting speed is adjustable by a front panel control and the apparatus runs silently and without attention for long periods.

LARGE CAPACITY: The flask platform accepts thirty-six 250 ml. flasks or equivalent. Various platforms are available for flasks of capacity up to 2 litres.

Price (incl. flask platform) £324. Ask for details quoting List No. IH-400

Antibiotic discs for sensitivity testing

Oxoid’s wide range of single and multiple discs has been developed to give completely reproducible results

Oxoid Sensitivity Discs are checked not only for their content of antibiotic, but also for their ability to release it on the medium. Each disc is marked with a symbol, clearly indicating the antibiotic and its level. They are vacuum dried during manufacture to a level of less than 0.1 per cent of moisture, to ensure stability and long shelf-life. They conform to standards laid down by the Antibiotics Division of the F.D.A.

The unique Oxoid medium, D.S.T. Agar Base, has been specifically developed for use with Sensitivity Discs.

Try time-saving Multodisks*

The ‘Multodisk’ carries six or eight antibiotics in a single unit—saving much time and effort. More than 40 different antibiotics are available in 22 standard combinations. For an order of 500 or more, Oxoid will provide any chosen combination at no extra cost.

For samples, information and a manual containing details of the Oxoid range, apply to:

'WELLCOME' brand DIAGNOSTIC REAGENTS

Never give cause for doubt

Those who value high quality will welcome
the following additions to the range:
Calf Serum, Fluorescent Anti-Clostridial Globulins,
Reduced Streptolysin-O, Chemical Control Serum,
Phytohaemagglutinin, Rabbit Serum,
Thyroglobulin Sensitised and Control Sheep Cells,
Thyroid Complement Fixing Antigen.
The 'Wellcome' range includes VIRUS REAGENTS
of the same high quality.

Journal of CELL SCIENCE

Formerly The Quarterly Journal of Microscopical Science

The Journal of Cell Science is devoted to all aspects of the study of cells. The scope of the journal is wide, and papers dealing with the entire range of investigations of cell organization, including accounts of advances in the relevant techniques, will be acceptable. Thus, in addition to studies of the structure and functions of plant and animal cells and their extracellular products (for example, cell walls, cuticles), papers will be published on such topics as cell growth and division, cell movements and interactions, and cell genetics. Contributions concerned with aspects of morphogenesis at the cellular and subcellular levels will also be acceptable. Studies of the organization of micro-organisms will be welcomed, as will papers dealing with the study of viruses, in so far as they are relevant to an understanding of cell organization (for example, those dealing with cell/virus interactions). Cytochemical papers will be acceptable, but histochemical work, in which the emphasis is on the localization of substances at the tissue level, will not ordinarily be included. Occasional review articles will be published.

Subscriptions £8 per volume of 4 parts, post free. Single parts 50s. postage extra. Copies may be ordered from your bookseller, or direct from the publishers

THE BIOCHEMICAL JOURNAL
Vol. 98, No. 2
CONTENTS February 1966

Studies on the biosynthesis of phenols in fungi. Conversion of 14C-chorismic acid and 14C-choron into fumaric acid by Aspergillus fumigatus var. II. By N. M. Packter.
The phosphorylated intermediate in the phosphoglycerate mutase reaction. By N. Zweig and C. Milstein.
Some observations on the biosynthesis of the plant sulpholipid by Euglena gracilis. By W. H. Davies, E. I. Mercer and T. W. Goodwin.

Metabolic changes in the skin of rats of various ages. Oxygen consumption and uptake of glucose. By B. K. Patnaik and M. S. Kanungo.

The effect of 1,6-furfurylamino purine on senescence in tobacco-leaf tissue after harvest. By J. W. Anderson and K. S. Rowan.

The chemical synthesis and biological oxidation of 7α-hydroxy-26,24-2C-cholesterol, 7-dehydro-26,24-2C-cholesterol and 26-hydroxy-26,24-2C-cholesterol. By F. G. D. Dean and M. W. Whitehouse.
The preparation and properties of skin chemically attached to carboxymethylcellulose. By W. E. Hornby, M. D. Liley and E. M. Crooke.

Effect of sex and gonadal hormones on rat plasma lipids during the development of an essential fatty acid deficiency. By R. L. Lyman, Rosemarie Ostwald, Pauline Bouchard and Angela Shannon.

Fluorescence studies on some hydroxypropylidines including compounds of the vitamin B
The biodehydrogenation of α-linoleic acid and oleic acid by rumen micro-organisms. By P. F. Wilde and R. M. C. Dawson.

Minor proteases in the stomach of the pig. By A. P. Ryle.
Studies on flavone in the guinea pig. By N. P. Das and L. A. Griffiths.

A new flavan-3,4-diol from Acacia auriculiformis by paper ionophoresis. By S. E. Drewes and D. G. Roun.

The determination of the substitution achieved at the α-amino, ε-amino and imidazole groups of proteins with special reference to derivatives of gelatin. By A. A. Leach.

Polyribosomes in rat-liver preparations. By T. J. Franklin and A. Godfrey.
The hypobranchial mucin of the whelk Buccinum undatum L. The polysaccharide sulphate component. By S. Hunt and F. R. Jevons.

The concentration and biosynthesis of nicotinamide nucleotides in the livers of rats treated with carcinogens. By J. B. Clark, A. L. Greensbaum and Patricia McLean.

Effects of prolonged incubation of isolated fat cells on their response to hormones stimulating lipolysis and glucose metabolism. By D. J. Galton and J. N. Fain.

Characterization of ribonucleases and ribonuclease inhibitor in subcellular fractions from rat adrenals. By N. S. Girid and A. Sreenivasan.
The enzymic oxidation of chlorogenic acid and some reactions of the quinone produced. By W. S. Pierpoint.

Electrophoretic and other studies on haem pigments from Rhodopseudomonas palustris: Cytochrome 552 and cytochromoid c. By R. W. Henderson and Diane D. Nankivelle.

Biosynthesis of nucleic acid purines in Mycobacterium tuberculosis H37Rv. By V. G. Malathi and T. Ramakrishnan.

Fatty acid composition of the plasma lipids of newborn and maternal ruminants. By W. M. F. Leat.

Ribonucleic acid synthesis during the early action of thyroid hormones. By J. R. Tata and C. C. Widnell.

Additive effects of thyroid hormone, growth hormone and testosterone on deoxyribonucleic acid-dependant ribonucleic acid polymerase in rat-liver nuclei. By C. C. Widnell and J. R. Tata.

Short Communications.

THE CHEMICAL SOCIETY
BURLINGTON HOUSE, LONDON, W.1
Vacancies have arisen in the Biological Research Division of the British Petroleum Company. The Division is situated at Grangemouth, Scotland, and its purpose is to develop a new fermentation process for the production of protein from hydrocarbons.

Applications are invited for the following positions:

**PROJECT LEADER, MICROBIOLOGY**

to lead a unit investigating both the strict microbiological and subsequent research aspects of protein production using laboratory scale fermentors. Applicants should be 30 years of age or over, with a good honours degree in a biological science, including microbiology with appropriate research experience and a knowledge of fermentation. Additional experience in biochemical engineering with regard to small scale fermentors would be an advantage. Ref. BR/3/TM.

**MICROBIOLOGIST**

for work within the Microbiological project. Applicants should be not more than 30 years of age with a good honours degree in a biological science including microbiology. Applications will be considered both from newly qualified graduates and from those with research experience particularly in fermentation. Ref. BR/26/TM.

**RESEARCH ANALYST**

for work both on the application of standard methods of analysis and the development of new methods. Experience in the application of classical and modern instrumental methods of analysis in relation to foodstuffs and biochemistry and a good understanding of spectroscopic methods (U.V. & I.R.) is necessary. A knowledge of chromatographic methods of separation would be an advantage. Applicants should preferably be 25-30 years of age with an appropriate honours degree or equivalent. Ref. BR/9/TM.

**BIOCHEMIST**

for work with the Biochemistry Project investigating cellular composition in relation to fermentation and harvesting conditions and the correlation of this composition with nutritional properties. Applicants should preferably be under 30 years of age with a good honours degree or equivalent. Ref. BR/5/TM.

Conditions of service are excellent and include a non-contributory pension fund and an assisted house purchase scheme. Write, giving brief details and quoting the appropriate reference number, to J. K. Todd, The British Petroleum Company Limited, Recruitment and Placement Branch, BP House, Ropemaker Street, London, E.C. 2.
SITUATIONS VACANT

Research Demonstrators in Microbiology

Applications are invited for posts of Research Demonstrator in the Department of Microbiology, The University of Reading, Berkshire, England. Appointments will in general date from 1 October 1966. Applicants should have qualifications in Microbiology, Bacteriology, Biochemistry or related subjects.

A Research Demonstrator will be expected to demonstrate in practical classes to a maximum of eight hours per week during term, and to engage in research.

There will be opportunity to register for a higher degree (M.Sc., Ph.D.).

Salary in scale £600 × 25—£650 per annum.

Apply in writing to Assistant Bursar (Personnel), University of Reading, Berkshire, England.

Imperial College

Young Graduate Microbiologist required to take part in three-year research project on bacterial spore formation. Salary according to qualifications and experience. Applications to Secretary, Biochemistry Department, Imperial College, London, S.W.7.

Classified advertising can be accepted at 7s. 6d. a line. Enquiries should be sent to Miss P. Walter, Cambridge University Press, Bentley House, 200 Euston Road, London, N.W. 1.
