Member of Baird & Tatlock Division of
Derbyshire Stone Group

The Journal of General Microbiology
is one of the 47 learned journals pub-
lished by Cambridge University Press.

A descriptive catalogue of Cam-
bridge journals with details of back
volumes is available from the London
and New York offices of the Press.

Cambridge journals may be
ordered from a bookseller or direct
from the publishers.

Genetical Research

Volume 13, Number 2,
April 1969

DEREK J. PIKE A comparison of two
methods for predicting changes in the
distribution of gene frequency when
selection is applied repeatedly to a
finite population

MOTOO KIMURA AND JAMES F. CROW
Natural selection and gene substitution

W. G. HILL On the theory of artificial
selection in finite populations

W. G. HILL The rate of selection advance
for non-additive loci

YUKIO YAMADA AND A. E. BELL Selection
for larval growth in Tribolium under
two levels of nutrition

BARBARA J. BYRNE Kappa, mu and the
metagon hypothesis in Paramecium aurelia

A. G. DICKINSON AND VERONICA M. H.
MEIKLE A comparison of some bio-
logical characteristics of the mouse-
passaged scrapie agents, 22A and ME7

S. W. GLOVER AND C. COLSON Genetics of
host-controlled restriction and modifi-
cation in Escherichia coli

Annual subscription £10 net ($33.00)
for six issues

CAMBRIDGE UNIVERSITY PRESS
CONTENTS

D. Keast. The murine runting syndrome and neoplasia.

D. Skalba and D. R. Stanworth. The specificity of the reactions of rheumatoid factors with different conformational forms of $\gamma$G-globulins of various species of origin.

Jean M. Dolby and D. E. Dolby. The antibody activities of $19S$ and $7S$ fractions from rabbit antisera to Bordetella pertussis.

J. Goose and A. M. J. N. Blair. Passive cutaneous anaphylaxis in the rat, induced with two homologous reagin-like antibody sera, and its specific inhibition with disodium cromoglycate.

J. G. Hall, Marilyn E. Smith, P. A. Edwards and K. V. Shooter. The low concentration of macroglobulin antibodies in peripheral lymph.

Elizabeth C. Marcuson and I. M. Roitt. Transformation of rabbit lymphocytes by anti-allotype serum: ultrastructure of transformed cells and suppression of responding cells by foetal exposure to anti-allotype serum.

Brief Communications

J. D. Hawkins. A note on the use of formalized sheep red cells in the passive haemagglutination test for antisera to bovine serum albumin

Kay FukuHaraka and F. Aladjem. The heterogeneity of the precipitating hapten $R_0$.

The subscription price is £16, post free, per two annual volumes of six parts. Single parts are 30s. each, postage extra

BLACKWELL SCIENTIFIC PUBLICATIONS
OXFORD AND EDINBURGH
he's using the best all-round medium for sensitivity testing

Oxoid D.S.T. agar base

This unique diagnostic sensitivity test agar gives clear, sharp zones of inhibition with both sulphonamides and antibiotics, and has the additional advantage of permitting direct observation of haemolytic activity.

The agar used in this medium contains no impurities to impede the diffusion of antibiotics such as Streptomycin, Kanamycin, Polymyxin B and Neomycin, which have been found particularly affected by some types of agar.

For samples, information and manual containing details of the Oxoid range, apply to:
Oxoid Limited, Southwark Bridge Road, London SE1.

OXOID for progressive laboratories
you found conventional meat extracts difficult to handle

so OXOID made free-flowing Lab-Lemco powder

Conventional meat extracts irritate the lab technician. They’re difficult to remove from jar or tin and even more difficult to remove from utensils or scale pans after weighing.

The latest breakthrough to come from the ’Oxoid’ laboratories is Lab-Lemco powder, a fine dry powder that remains free flowing under most conditions. It reconstitutes easily to make a clear, sparkling bouillon of the highest quality.

Made from specially selected extracts of very light colour, Lab-Lemco powder can be used with other Oxoid refined ingredients to make up media which require no filtration.

Culture media prepared with Lab-Lemco powder need only 80 per cent of the weight of ordinary meat extracts, the resultant broth is light and clear with excellent growth promoting properties. And media incorporating Lab-Lemco powder enhance the growth of many organisms, including Streptococci, where growth and haemolysis are markedly improved.

For samples, information and a manual containing details of the Oxoid range, apply to: Oxoid Limited, Southwark Bridge Road, London S.E.1.

The ability to change specimen holders with ease and speed is a significant benefit built into the AEI EM801.

You can choose from:
(a) A specimen holder to carry six specimens at once.
(b) A specimen holder to tilt specimens ± 20°.
(c) A specimen holder to tilt specimens ± 30°.
(d) A specimen holder to examine a string of up to 250 serial sections.

All holders are of the plug-in type, directly interchangeable, and are electronically driven at a controlled speed. The objective focal length and resolution of the microscope does not alter with change of specimen holders.

These advanced and versatile specimen handling facilities, coupled with a genuine 5Å point-to-point resolution, are but some of the outstanding features of the AEI EM801.

Leadership through choice

AEI's strength in electron microscopy lies in long term development, the results of which enable them to offer a range of six other electron microscopes to meet most budget requirements and research applications.

EM7—The European million volt electron microscope.
EM8—3Å resolution for ultimate resolution research.
EM802—Full goniometer facilities for crystallography.
EM68—Long established and well tried high resolution instrument for biologists.
EM6G—A general purpose instrument for all research.
EM6M—A high quality medium-priced instrument for small budgets.

AEI
What is zonal centrifugation and how could it help you?

Zonal centrifugation permits the fractionation of relatively large volumes of sample in a density gradient and offers excellent resolving powers, outstanding sharpness of separation and great convenience in operation, in addition to the advantage of scale. This greatly simplifies subsequent biochemical investigations by enabling large amounts of pure fractions of labile biochemical materials to be prepared quickly and consequently with little deterioration.

MSE were one of the first manufacturers to appreciate the importance of this new technique, and to make available a comprehensive range of zonal rotors of advanced design and dependable performance.

Now MSE can offer zonal rotors as standard accessories for many of the MSE range of centrifuges, including the Mistral 6L, the High Speed 18 and High Speed 25, the Super Speed 40, Super Speed 50 and Super Speed 65.

Various papers describing the principles and different applications of zonal rotors are available on request.
