For controlled environment continuous culture apparatus - in a single console...

CX-650 Culture apparatus, CeCa, Gallenkamp, for continuous and batch culture of organisms. The complete system, comprising culture vessel, nutrient, harvest and reagent bottles, is constructed on a trolley which withdraws from the console down a fold-away ramp for autoclaving as a unit or as individual components.

For full details please ask for Publication 667. All orders are accepted subject to our published Conditions of Sale.
The Journal of Applied Bacteriology
edited for the Society for Applied Bacteriology
by F. A. Skinner
and G. Sykes
Long-established as an international medium for original papers embracing the many aspects of applied bacteriology, the Journal serves the widening interests of microbiologists in all fields of research.

Contents of Volume 35 No. 3, September 1972, will include:
- The fluorescent antibody technique for the detection of Salmonella in routine use. Inactivation of strains of Salmonella senftenberg by Gamma irradiation. A new medium for Bacillus thuringiensis Berliner. The effect of porcine mycoplasmas on pig tracheal organ cultures. The ecology and classification of strains of Lactobacillus collinoides nov.spec.: a bacterium commonly found in fermenting apple juice. Interrelationship between colony type, phage susceptibility and virulence in Xanthomonas oryzae. Bacteria antagonistic to Pseudomonas tolaasii and their control of brown blotch of the cultivated mushroom Agaricus bisporus. Sources and quantities of yeast extract for growth of rhizobia. A survey of the occurrence of Vibrio parahaemolyticus and V. alginolyticus on mussels and oysters and in estuarine waters in the Netherlands. Plant growth substances produced by microorganisms of soil and rhizosphere. Fermentation of cane molasses by yeasts after preservation under conditions of high sugar concentration. The destruction of Byssochlamys fulva ascii by low concentrations of gaseous methyl bromide and by aqueous solutions of chlorine, an iodophor and peracetic acid. Biological control of crown gall: seed inoculation.

The Journal of Hygiene
Volume 70, No. 3  September 1972

t Contents
P. Whittlestone, Ruth M. Lemcke, and R. J. Olds. Respiratory disease in a colony of rats. II. Isolation of Mycoplasma pulmonis from the natural disease, and the experimental disease induced with a cloned culture of this organism.
R. G. A. Sutton, Margaret Kendall and Betty C. Hobbs. The effect of two methods of cooking and cooling on Clostridium welchii and other bacteria in meat.
Sheila M. Barker and L. Hoyle. The nature of the toxic reaction of influenza virus towards lung tissue.
G. S. Turner. Rabies vaccines and interferon.
D. G. Davies and R. W. S. Harvey. Anthrax infection in bone meal from various countries of origin.
P. R. M. Steele. Protection of T4 bacteriophage against inactivation during freezing and thawing by addition of peptides.
J. E. Craddock-Watson, M. S. Bourne and Elise M. Vandervekke. IgG, IgA and IgM responses in acute rubella determined by the immunofluorescent technique.
A. F. B. Standfast and Jean M. Dolby. The influence of the route of immunization on the protection of mice infected intracerebrally with Bordetella pertussis.

£2.00 net (£1.20 in the USA). Annual subscription £7.00 net (£23.00 in the USA) for four parts.

Cambridge University Press
Bentley House, 200 Euston Road, London NW1 2DB
American Branch: 32 East 57th Street, New York, N.Y.10022.

R. N. Gourlay, C. J. Howard and J. Brownlie. The production of mastitis in cows by the intramammary inoculation of T-mycoplasmas.
R. Jennings. Adenovirus, parainfluenza virus and respiratory syncytial virus antibodies in the sera of Jamaicans.
D. S. Freeston, Stephanie Hamilton-Smith, G. C. Schuld, Rosemary Buckland, Susan Chinn and D. A. J. Evrard. Antibody responses and resistance to challenge in volunteers vaccinated with live attenuated, detergent split and oil adjuvant A2/Hong Kong/68 (H3N2) influenza vaccines.
Mair E. M. Thomas, Yasmin Haider and Naomi Datta. An epidemiological study of strains of Shigella sonnel from two related outbreaks.
DYNO-MILL
FOR
CONTINUOUS
CELL DISINTEGRATION

Yeast, bacteria, fungi, algae and other micro-organisms are mechanically disintegrated in the DYNO-MILL KDL in continuous production or batch work at low temperatures for isolation of proteins, enzymes and other cell constituents with a yield up to 90%—100%

OUTPUT

Laboratory DYNO-MILL KDL Batch operation: 150 ml of suspension in about 1—3 minutes
Continuous work: 2—10 litres of suspension per hour.

Industrial DYNO-MILLS Up to 300 litres per hour in the larger DYNO-MILLS. Machines with an even larger output under development.

For further information and prices, and for trial disintegration of your samples in your own laboratory contact the U.K. sole distributors and service organisation:

GLEN CRESTON
37 The Broadway, Stanmore, Middx HA7 4DL, England. Tel: 01-3954-4218.
Telegrams: Glencrest, Stanmore.

Enquiries outside the U.K. and Eire please address direct to the manufacturer:
