Proposed Rewording of Rule 10C of the Bacteriological Code

J. J. FARMER III
Enteric Bacteriology Section, Center for Infectious Diseases, Centers for Disease Control, Atlanta, Georgia 30333

It is proposed that Rule 10C of the Bacteriological Code be reworded slightly to avoid confusion. The name of a subgenus, when included in the name of a species, is indicated by including the abbreviation “subgen.” along with the name of the subgenus [example: Bacillus (subgen. Aerobacillus) polymyxa].

Recent correspondence about changes in the nomenclature of the “Salmonella-Arizona” group of Enterobacteriaceae has pointed out potential confusion that can be caused by a rule in the International Code of Nomenclature of Bacteria (1). In 1983, our laboratory discontinued the use of the genus name Arizona and classified these organisms in the genus Salmonella with the notation “Salmonella (Arizona) serotype...” to indicate that Arizona was the name formerly used. Most microbiologists seem to use “the definition of parentheses” in a general grammatical sense. For example, “Morganella (Proteus) morganii” is almost always used to indicate that the genus name being used by the author is Morganella but that the genus name Proteus has also been used or is in current use for this genus. The genus name in parentheses is meant as an “alternative name,” which may be familiar (perhaps, even more familiar) to some readers. Other examples which have recently occurred in print include Providencia (Proteus) rettgeri, Vibrio (Beneckea) gazogenes, Legionella (Tatlockia) micdadei, Tatlockia (Legionella) micdadei, and Gardnerella (Haemophilus) vaginalis. Parentheses are almost always used by microbiologists in this general context as a useful means of communicating an alternative genus name. However, there is a rule of the Bacteriological Code which can cause confusion when compared with this usage by microbiologists.

Rule 10C of the Bacteriological Code (p. 14 and 15 of reference 1) states:

The name of the subgenus, when included in the name of a species, is placed in parentheses between the generic name and specific epithet.
Example: Bacillus (Bacillus) subtilis; Bacillus (Aerobacillus) polymyxa.

Thus, when this rule is applied to the example given previously, the interpretation of “Morganella (Proteus) morganii” is that Morganella is the genus name and Proteus is the subgenus name. Since the concept of subgenus seems to be of little value in microbiology and since normal usage by microbiologists is different from Rule 10C, it seems prudent to reword Rule 10C slightly to avoid this confusion. As provided in Article 8a (p. 142 of reference 1), I request that the Judicial Commission and the International Committee on Systematic Bacteriology consider the following emendation of the Bacteriological Code.

Rule 10C
The name of a subgenus, when included with the name of a species, is placed in parentheses, along with the abbreviation subgen., between the generic name and the specific epithet.
Example: Bacillus (subgen. Bacillus) subtilis; Bacillus (subgen. Aerobacillus) polymyxa.
