A Gram-positive, aerobic, actinobacterial strain with rod-shaped spores, designated YIM 63158T, was isolated from the surface-sterilized roots of Artemisia annua L. collected from Yunnan province, south-west China. Phylogenetic analysis based on 16S rRNA gene sequences showed that strain YIM 63158T belonged to the genus Pseudonocardia. The closest neighbours were ‘Pseudonocardia sichuanensis’ KLBMP 1115 (99.9 % 16S rRNA gene sequence similarity), Pseudonocardia adelaidensis EUM 221T (99.1 %) and Pseudonocardia zijingensis DSM 44774T (98.8 %); sequence similarities to other members of the genus Pseudonocardia ranged from 98.6 to 94.4 %. The chemotaxonomic characteristics, such as the cell-wall diaminopimelic acid, whole-cell sugars, fatty acid components and major menaquinones, suggested that the isolate belonged to the genus Pseudonocardia. The G+C content of the genomic DNA was 73.3 mol%. On the basis of physiological, biochemical and chemotaxonomic data, including low DNA–DNA relatedness between the isolate and other members of the genus Pseudonocardia, it is proposed that strain YIM 63158T represents a novel species in this genus, with the name Pseudonocardia kunmingensis sp. nov. The type strain is YIM 63158T (= DSM 45301T = CCTCC AA 208081T).

The genus Pseudonocardia within the family Pseudonocardiaceae was described by Henssen (1957) and since then the description of the genus has been emended repeatedly (Warwick et al., 1994; McVeigh et al., 1994; Reichert et al., 1998; Huang et al., 2002; Park et al., 2008). At the time of writing, the genus Pseudonocardia encompasses 38 species with validly published names (http://www.bacterio.cict.fr; Ara et al., 2011; Kaewkla & Franco, 2010, 2011; Qin et al., 2010; Sakiyama et al., 2010; Zhao et al., 2011). Members of the genus Pseudonocardia have the following characteristics. Aerial mycelium may be present. The vegetative mycelium may fragment. The spores are normally smooth and form chains by acropetal budding or septation on the substrate or aerial mycelium. Alternatively, the spores are formed in longitudinal pairs on vegetative hyphae and singly or in longitudinal pairs on aerial hyphae. The chemotaxonomic characteristics are a type-IV cell wall, predominant menaquinone MK-8(H4) or MK-9(H0), DNA G+C content of 68–79 mol%, no mycolic acids and phospholipid type II, III or IV. Strains of this genus have been isolated from various environmental samples, such as activated sludge, soils and plant samples (Gu et al., 2006; Chen et al., 2009; Duangmal et al., 2009; Kaewkla & Franco, 2010, 2011; Qin et al., 2010, 2011; Zhao et al., 2011).

In the course of our research on new actinobacterial sources, strain YIM 63158T was isolated from the roots of Artemisia annua L. collected in Kunming, Yunnan province, south-west China. Samples were washed in running water to remove soil particles, surface-sterilized by an established procedure (Li et al., 2008), sliced and placed on HV agar (Hayakawa & Nonomura, 1987). The plates were incubated at 28 °C for 4–6 weeks until
outgrowth of endophytic actinomycetes was discerned. Colonies originating from plant segments were selected and pure cultures were obtained by repeated streaking on TWYE agar (containing [1 tap water]⁻¹: 0.25 g yeast extract, 0.5 g K₂HPO₄, 18 g agar; pH 7.2). Strain YIM 63158ᵀ was maintained on tryptic soy agar (TSA) slants at 4 °C and as 20 % (v/v) glycerol suspensions at −70 °C. Biomass for chemical and molecular studies was obtained by cultivation in shake flasks (about 200 r.p.m.) using tryptic soy broth [TSB; containing (l tap water)⁻¹: 15 g tryptone, 5 g soya peptone, 5 g NaCl; pH 7.2] at 28 °C for 1 week.

Gram staining was carried out using the standard Gram reaction and cell motility was confirmed by the development of turbidity throughout a tube containing semi-solid medium (Leifson, 1960). The morphological characteristics of strain YIM 63158ᵀ, including spore-chain morphology, spore size and surface ornamentation, were assessed by light and scanning electron microscopy (XL30 and ESEM-TMP; Philips) of 14-day-old cultures prepared on YIM 38 medium (Zhao et al., 2010). Aerial spore-mass colour, substrate mycelium pigmentation and coloration of the diffusible pigments of strain YIM 63158ᵀ were recorded on International Streptomycetes Project (ISP) media (Shirling & Gottlieb, 1966), Czapek’s agar, potato–glucose agar and nutrient agar prepared as described by Dong & Cai (2001). Colours were determined using colour chips from the ISCC-NBS colour charts (standard sample no. 2106) (Kelly, 1964). Growth at 4, 10, 20, 28, 37, 40, 42, 45, and 55 °C was tested on TSA for 21 days. Growth at pH 4–10 (in increments of 1 pH unit using the buffer system described by Xu et al. 2005) and growth with 0, 1, 3, 5, 7, 8, 9, 10, 15 and 20 % (w/v) NaCl were tested in TSB at 28 °C for 14–21 days. Catalase, oxidase and gelatinase activities, starch hydrolysis, nitrate reduction and urease were assessed as described by Smibert & Krieg (1994). Other physiological and biochemical tests were performed as described by Gordon et al. (1974).

Cells of strain YIM 63158ᵀ were Gram-positive, aerobic and non-motile. Strain YIM 63158ᵀ grew well on ISP 2, ISP 3, ISP 4, ISP 5, Czapek’s agar, nutrient agar and potato–glucose agar. White aerial mycelium was produced on ISP 2, ISP 3, ISP 4, ISP 5, Czapek’s agar and potato–glucose agar, but no aerial mycelium was formed on nutrient agar. The substrate mycelium varied from orange to orange–yellow on the media tested and a diffusible pigment (brown–yellow) was observed on potato–glucose agar (Supplementary Table S1, available in IJSEM Online). Morphological observation of a 14-day-old culture of strain YIM 63158ᵀ revealed that both aerial and vegetative hyphae were abundant, well-developed and fragmented. The mycelia displayed long spore chains, containing up to 10 rod-shaped and smooth-surfaced spores (0.9–1.0 × 1.1–2.5 μm; Supplementary Fig. S1). The results showed that strain YIM 63158ᵀ had morphological properties typical of the genus Pseudonocardia. The isolate grew at 10–40 °C, pH 6.0–9.0 and 0–7 % (w/v) NaCl. Optimal growth was observed at 28 °C, pH 7.0–8.0 and 1–3 % NaCl. The isolate was catalase-positive and oxidase-negative. Detailed physiological and biochemical properties are given in Table 1 and the species description. It is evident from Table 1 that there were some phenotypic differences between strain YIM 63158ᵀ and its closest phylogenetic neighbours.

The isomer of diaminopimelic acid and sugar analyses of whole-cell hydrolysates were performed according to the procedures described by Hasegawa et al. (1983), Lechevalier & Lechevalier (1970) and Tang et al. (2009). Phospholipids were extracted, examined by two-dimensional TLC and identified using procedures described elsewhere (Minnikin et al., 1979; Collins & Jones, 1980). Menaquinones were isolated according to Collins et al. (1977) and separated by HPLC (Tamaoka et al., 1983). Mycolic acids were extracted and analysed by one-dimensional TLC as described by Minnikin et al. (1980). Cellular fatty acids were extracted and methylated using the Sherlock Microbial Identification System (MIDI) according to the manufacturer’s instructions. The fatty acid composition of the isolate was as follows: 15:0 (17.0 %), 16:0 (21.4 %), 16:1ω7c (13.7 %), 16:1ω6c (8.7 %), 17:0 (17.4 %), 17:0ω3c (11.4 %), 18:0 (12.9 %), 18:1ω7c (17.1 %), 18:1ω6c (17.3 %), 18:2ω6ω9 (12.1 %), 18:3ω6ω9 (18.7 %), 19:0ω7c (3.9 %), 20:0ω9c (3.0 %), 20:1ω6c (2.7 %), 21:0ω7c (1.1 %), 22:0ω5c (1.6 %), and 23:0ω5c (1.3 %). The fatty acid composition of the closest neighbour, P. savastanoi DSM 45352ᵀ, was 15:0 (20.4 %), 16:0 (20.9 %), 16:1ω7c (11.2 %), 16:1ω6c (10.3 %), 17:0 (17.2 %), 17:0ω3c (10.8 %), 18:0 (18.7 %), 18:1ω7c (12.4 %), 18:1ω6c (10.8 %), 18:2ω6ω9 (16.6 %), 18:3ω6ω9 (19.5 %), 19:0ω7c (2.2 %), 20:0ω9c (1.9 %), 20:1ω6c (2.0 %), 21:0ω7c (1.2 %), 22:0ω5c (1.4 %) and 23:0ω5c (1.3 %). The results showed that the isolate was similar to the closest neighbour, with the exception of 15:0, 16:1ω7c, 16:1ω6c and 18:3ω6ω9.

The results of the whole-cell hydrolysates and fatty acid analysis are consistent with the identification of the isolate as representing a new species within the genus Pseudonocardia. The isolate was therefore designated as Pseudonocardia kunmingensis sp. nov. Strains: 1, Pseudonocardia kunmingensis sp. nov. YIM 63158ᵀ; 2, `P. sichuanensis’ KLBMP 1115; 3, P. adelaideensis DSM 45352ᵀ; 4, P. zijingensis DSM 44774ᵀ. All data were taken from this study unless otherwise indicated. All strains are Gram-positive, non-motile and catalase- and urease-positive, grow under aerobic conditions, with 5 % (w/v) NaCl, at pH 6.0–8.0 and at 10–40 °C, and utilize glucose, D-mannitol, D-mannose, raffinose, L-rhamnose and ribose. No strains utilize dulcitol. +, Positive; w, weakly positive; −, negative.

*Data for columns 2–4 were taken from Qin et al. (2011), Kaeckla & Franco (2010) and Huang et al. (2002), respectively.
acid methyl esters were analysed by GC (7890A GC System; Agilent Technologies) using the Microbial Identification software package (Sherlock version 6.1, MIDI database TSBA6).

The results indicated that the cell-wall diamino acid in the peptidoglycan layer of strain YIM 63158<sup>T</sup> was meso-diaminopimelic acid and the whole-cell sugars were glucose, arabinose, galactose, mannose and ribose. The phospholipids consisted of diphosphatidylglycerol, phosphatidylethanolamine, phosphatidylcholine, phosphatidylinositol, phosphatidylglycerol and an unknown glycolipid. MK-8(H<sub>4</sub>) (95.5%) was the predominant menaquinone; MK-8(H<sub>6</sub>) (2.8%) and MK-8(H<sub>2</sub>) (1.7%) were detected as minor components. The predominant menaquinone of strain YIM 63158<sup>T</sup> was similar to those of closely related strains; in

![Diagram](image)

**Fig. 1.** Neighbour-joining phylogenetic tree based on 16S rRNA gene sequences showing the relationship of strain YIM 63158<sup>T</sup> with members of the genus *Pseudonocardia*. Bootstrap values (>50%) based on 1000 replications are shown at branch nodes. Asterisks indicate that the corresponding nodes were also recovered in trees generated using the maximum-parsimony and maximum-likelihood methods. Bar, 0.005 substitutions per nucleotide position.
particular, MK-8(H4) is a predominant menaquinone in most recognized species of the genus *Pseudonocardia*. Mycolic acids were absent. The major fatty acids were iso-C16:0 (37.14 %), C16:0 10-methyl (13.76 %), anteiso-C17:0 (10.51 %), C16:1ω6c/ω7c (6.40 %), C16:0 (5.73 %) and iso-C15:0 (4.63 %), which were similar to those described for the genus *Pseudonocardia*. However, there were differences with the reference strains (Supplementary Table S2): for example, strain YIM 63158T contained high amounts of anteiso-C17:0 and C16:0 10-methyl, but *P. sichuanensis* KLBMP 1115, *P. adelaidensis* DSM 45352T and *P. zijingensis* DSM 44774T contained lower amounts of these fatty acids. The chemotaxonomic characteristics of strain YIM 63158T, such as the diaminopimelic acid isomer and sugars in whole-cell hydrolysates, menaquinones, major fatty acids and phospholipids, were consistent with its assignment to the genus *Pseudonocardia*.

Extraction of genomic DNA and PCR amplification and sequencing of the 16S rRNA gene were performed as described by Li *et al.* (2007). Multiple alignments with sequences of the most closely related actinobacteria and sequence similarity calculations were carried out using CLUSTAL X (Thompson *et al.*, 1997). The phylogenetic trees were constructed by the neighbour-joining (Saitou & Nei, 1987), maximum-parsimony (Fitch, 1971) and maximum-likelihood (Felsenstein, 1981) tree-making algorithms using the software packages MEGA version 4.0 (Tamura likelihood (Felsenstein, 1981) tree-making algorithms containing *

**Description of Pseudonocardia kunmingensis**

*Pseudonocardia kunmingensis* (kun.min.gen’sis. N.L. fem. adj. kunmingensis of or pertaining to Kunming, a city of Yunnan in south-west China). Aerobic, non-motile, Gram-positive actinomycete that forms extensively branched substrate and aerial mycelia. The aerial mycelium carries smooth-surfaced, rod-shaped spores. Forms white aerial mycelium and orange to yellow-orange substrate mycelium. A diffusible pigment (brown–yellow) is observed on potato–glucose agar. Grows at 10–40°C (optimum 28°C), at pH 6.0–9.0 (optimum pH 7.0–8.0) and with 0–7 % (w/v) NaCl [optimum 1–3 % (w/v) NaCl]. Positive for catalase and urease, but negative for milk coagulation and peptonization, nitrate reduction, oxidase, gelatin liquefaction, cellulose and starch hydrolysis and H2S production. Tween 40 is hydrolysed, but Tweens 20 and 80 are not hydrolysed. As sole carbon sources, utilizes D-arabinose, cellobiose, D-fructose, D-galactose, glucose, myo-inositol, lactose, maltose, D-mannitol, D-mannose, raffinose, L-rhamnose, D-ribose, D-sorbitol and D-xylene, but not dulcitol, glycerol, sodium acetate or...
sucrose. As sole nitrogen sources, utilizes L-alanine, L-arginine, L-asparagine, glycine, L-hydroxyproline, hypoxanthine, L-lysine, L-phenylalanine, L-serine, L-tyrosine, L-valine and xanthine. Produces acid from D-mannose and D-ribose. The cell wall contains meso-diaminopimelic acid. The whole-cell sugar pattern consists of glucose, arabinose, galactose, mannose and ribose. MK-8(H_4) is the predominant menaquinone. The phospholipids consist of diphosphatidylglycerol, phosphatidylmethylethanolamine, phosphatidylycholine, phosphatidylinositol, phosphatidylglycerol and an unknown glycolipid. Mycolic acids are absent. The major fatty acids are iso-C_{15:0} , C_{16:0} 10-methyl, anteiso-C_{17:0} , C_{16:0} 10 methyl, C_{16:1} 5Z , C_{16:1} 0 and iso-C_{15:0} . The G+C content of the type strain is 73.3 mol%. The type strain, YIM 63158{T} (=DSM 45301{T} =CCTCC AA 208081{T} ), was isolated from surface-sterilized roots of Artemisia annua L. collected from Kunming, Yunnan province, south-west China.

Acknowledgements

The authors are grateful to Professor Hans-Peter Klenk and Dr Qin Sheng for kindly providing the reference type strains. This research was supported by the National Basic Research Program of China (grant no. 2010CB833800) and the National Natural Science Foundation of China (grant no. U0932601).
