This is not a pocket book but is one to which all infection-control officers and nurses should have access. 

ROBERT BLOWERS

Introduction to sterilisation and disinfection

The authors intend this book to cover the subjects of sterilisation and disinfection for medical, dental and science students, and to be used, also, as a textbook in specialised courses for microbiologists and for post-basic education and training of hospital staff. This is a very wide range. Books of this sort can be divided into those that provide a good knowledge of principles and background and those used for every-day reference to solve specific problems. This book belongs to the former category. After the initial chapter on basic microbiology and terminology, eight chapters cover various methods and aspects of sterilisation and the next two disinfection, with only the final chapter dealing with applications of sterilisation and disinfection and hospital policies.

Over the last few years, sterilisation has become more the province of the engineer than the microbiologist, and books like this provide useful explanations to non-engineers at an understandable level. The book covers methods common in hospitals, wet and dry heat, and rare or absent in hospitals, gas sterilisation and ionising radiation, clearly and intelligently, in both principle and application. Disinfection, on the other hand, is more the province of the microbiologists, yet receives comparatively little attention in this book, certainly not enough for an everyday working knowledge of the subject.

The book is called an 'introduction' to the subjects and so it is, and its price makes it accessible to most who continue to take an interest in sterilisation and disinfection.

AIDS—INFORMATION SERVICES FROM THE BUREAU OF HYGIENE & TROPICAL DISEASES

- On-line access to AIDS abstracts
  - abstracts of important papers from over 1100 journals, critically evaluated and rapidly uploaded
  - available now on CAB International and soon through DataStar and BRS Information Technologies

- AIDS and Retroviruses Update Service
  - monthly listing of titles from many sources, with titles grouped by subject: annotations indicate coverage of paper

  Subscription rate: £80; Overseas £95 per annum* (also available on-line)

- AIDS Newsletter
  - summarizes recent major news items from the UK and abroad, as well as latest clinical and scientific developments
  - lists meetings and other important information for health-care workers

  Subscription rate: £45 per annum* (£57 overseas)

*Prices include postage; please send cash with order to:
