SHORT COMMUNICATIONS

A Note on the Occurrence of Core-like Structures in Association with *Erysipelothrix rhusiopathiae*

By M. R. STUART*

(Received 28 April 1972)

Abrams, Nielson & Thaemert (1964) and Cohen, McCandless, Kalmanson & Guze (1968) have reported core-like structures, occurring in transitional and protoplast forms of *Streptococcus faecalis*. These were 0.08 to 0.13 μm thick, and consisted of a variably electron-dense tube containing ribosome-like particles.

A recent paper by McCandless et al. (1971) suggests that these cores are specific for group D streptococci, but similar core-like structures occur in cultures of *Erysipelothrix*

Fig. 1. *Erysipelothrix rhusiopathiae* NCTC 807, showing core-like structure with surrounding double layer. Scale marker represents 0.3 μm.

Short communication

Erysipelothrix rhusiopathiae (NCTC strains 807 and 8163) cultured on (g/l): tryptone, 10; Lab Lemco bee extract, 3; blood agar base no. 2, 40, pH 7.2; and incubated at 37°C for 5 days. Organisms were harvested by centrifuging at 15000 g for 30 min, washed thrice with distilled water, resuspended in 10% iso-propanol, and dried on collodion on formvar membranes.

Electron microscopical examination revealed the presence of core-like structures 0.3 to 0.4 µm long and 0.05 to 0.075 µm wide, in the older cultures, especially in strains showing dissociation and associated L-form bodies; Fig. 1 shows the typical appearance of the structures, which consisted of flat-ended cylinders based upon a central core around which could often be detected a uniformly constructed double layer; always lying along the long axis of the organism and frequently giving the appearance of being intimately attached to the cell wall.

Although rather smaller, these core-like structures resemble those found in Streptococcus faecalis. Both Davis, Fomin, Wilson & Newton (1969) and Stuart & Pease (1972), on the basis of numerical analysis of data, have shown that Erysipelothrix rhusiopathiae has close phenotypical relations to the streptococci, of which this may be further evidence.
